

Bohadschia vitiensis - MASKELYNE_2011-09

The selected data includes **72 habitat zone(s)** of the study area (**24.54 km²**). The field census occurred from 12/09/2011 to 15/09/2011. **286 transects** are considered in the results below.

Reference indicators for all individuals

Reference indicators include biomass, abundance and density estimates.

The conservative stock biomass of all individuals is **9797 kg** (wet) and the conservative total abundance is **20430 individual(s)**. This wet biomass is equivalent to **4899 kg** of gutted and salted products, and **392 kg** of dried products (bêche-de-mer).

The conservative mean density estimate of all individuals is **8 individual/ha** and **4 kg/ha** over the selected habitat zones .

The above estimates incorporate measure uncertainty that is attributable to survey method and heterogeneous resource distribution over the survey site.

Biological interpretation

Legal-sized individuals (250 mm) represent **42 % of the total stock biomass**. This low proportion is attributable to the common observation of small individuals in the survey compared to adults (see charts below) and is indicative of local recruitment. **Resources may be harvested following the recommended TAC (see table).**

Total stock estimates for Bohadschia vitiensis

(all sizes)	40.751 t ± 30.954 t

Recommended TAC (Total Allowable Catch, or quota) of legal-sized individuals (250 mm) :

Fresh/wet products	4.082 t
--------------------	---------

Salted and gutted products	2.041 t

Dried products (bêche-de-mer)	0.163 t
